

Project Design Phase-II

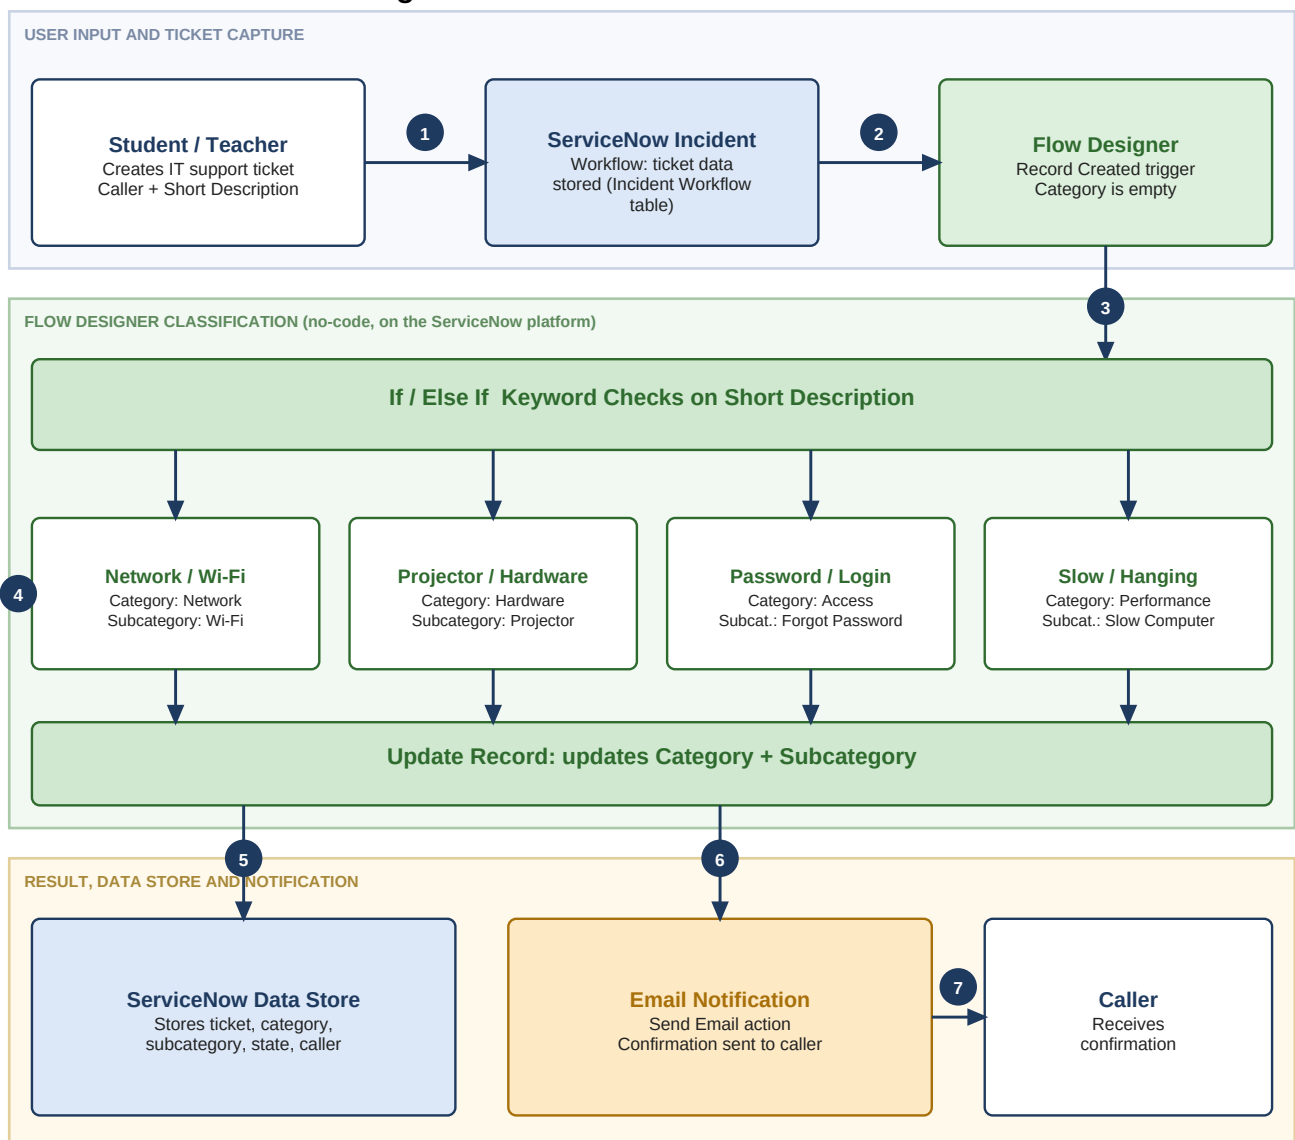

Technology Stack (Architecture & Stack)

Team ID	SWTID-2026-7595
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Technical Architecture:

The solution uses ServiceNow Flow Designer to automatically classify school IT incident tickets from the Short Description and update Category and Subcategory without manual intervention.

Technical Architecture Diagram

1 Ticket created with Caller and Short Description 2 Record Created trigger starts the flow 3 Short Description checked for keywords 4 Matching branch selects Category and Subcategory 5 Ticket data saved 6 Confirmation email sent 7 Caller receives confirmation

Architecture Components

- User input: Caller and Short Description.
- Data layer: Incident Workflow table stores ticket and classification information.
- Automation: Flow Designer Record Created trigger with If / Else If keyword conditions.

- Classification: Network/Wi-Fi, Hardware/Projector, Access/Forgot Password, Performance/Slow Computer.
- Notification: Send Email action confirms ticket creation to the caller.

Table-1 : Components & Technologies

S.No	Component	Description	Technology
1	User Interface	Students / teachers enter Caller and Short Description.	ServiceNow Incident Workflow form
2	Application Logic-1	Starts classification when a ticket is created and Category is empty.	ServiceNow Flow Designer
3	Application Logic-2	Checks Short Description for Wi-Fi/Network, Projector, Password/Login, or Slow/Hanging keywords.	Flow Designer If / Else If
4	Application Logic-3	Updates Category and Subcategory and sends a confirmation email.	Update Record + Send Email
5	Database	Stores ticket number, caller, category, subcategory, descriptions, state, and assignment references.	ServiceNow Incident Workflow table
6	Cloud Database	Persistent ticket data is maintained within the ServiceNow platform.	ServiceNow platform data store
7	File Storage	No separate file-storage requirement is specified in the project.	Not required / not specified
8	External API-1	No external API is used by the described classification flow.	None
9	External API-2	No second external API is used by the described classification flow.	None
10	Machine Learning Model	Classification uses rule-based keyword matching; no ML model is used.	None – Flow Designer logic
11	Infrastructure (Server / Cloud)	Runs on the ServiceNow platform and is configured through the ServiceNow instance.	ServiceNow instance / cloud platform

Table-2: Application Characteristics

S.No	Characteristics	Description	Technology
1	Open-Source Frameworks	No open-source framework is used; the solution is implemented as a no-code ServiceNow Flow Designer configuration.	ServiceNow Flow Designer
2	Security Implementations	ServiceNow access controls and user/group references are used. Detailed security controls are not specified in the project.	ServiceNow access controls / roles
3	Scalable Architecture	The no-code flow and structured ticket table can be extended with additional classification rules and future automation.	Flow Designer + ServiceNow table
4	Availability	The project uses the ServiceNow platform; specific load-balancing or distributed-server configuration is not specified.	ServiceNow platform
5	Performance	Event-triggered keyword matching avoids manual review for each ticket. Exact requests-per-second targets are not specified.	Flow Designer conditions + Update Record

Project Scope Reference

The project describes a school IT helpdesk solution that automatically classifies tickets based on keywords in the Short Description, updates Category and Subcategory, and sends an email notification to the caller.

References

- ServiceNow Flow Designer – platform technology used for ticket classification automation.
- ServiceNow Incident Workflow table – project configuration and structured ticket data.
- ServiceNow platform – environment used for configuration, data storage, flow execution, and notifications.
