

Project Development Phase

Automation Performance & Validation Test

Team ID	SWTID-2026-7595
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	10 Marks

Automation Performance Testing:

The project team can use the following information to validate the Flow Designer automation. Machine-learning metrics are not applicable because the documented solution is a no-code keyword-based Flow Designer implementation.

S.No.	Parameter	Values	Screenshot
1	Classification / Automation Validation	Keyword rules: WiFi/Network – Network/Wi-Fi; Projector – Hardware/Projector; Password/Login – Access/Forgot Password; Slow/Hanging – Performance/Slow Computer. Validation: verify the resulting Category and Subcategory for each test ticket.	
2	Data Validation	Auto-number uniqueness; Caller reference; Assigned Group/Assigned To references; Category and Subcategory accuracy; State values.	
3	Automation Validation	Trigger: Record Created. Condition: Category is Empty. Action: Update Record with Category/Subcategory based on Short Description.	
4	Notification Validation	Send Email action to Caller – Email after classification; verify subject and ticket confirmation message.	
5	Performance / Load Validation	Create multiple tickets with different issue descriptions and confirm consistent flow execution and record updates.	

Note: No MAE, MSE, RMSE, R^2 , confusion matrix, or model hyperparameter tuning is specified in the Auto Ticket Classification project documentation; therefore these are marked as not applicable rather than inventing values.
