

Project Development Phase

Data & Report Validation Test

Team ID	SWTID-2026-7595
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	

Project Data Validation Testing:

The following checks are adapted to the documented ServiceNow project. Power BI/DAX-specific items are not claimed because the project documentation describes ServiceNow tables, Flow Designer automation, testing and email notification.

S.No.	Parameter	Screenshot / Values
1	Ticket Data Captured	Caller, Short Description, Description, Number, Category, Subcategory, State, Assigned Group and Assigned To.
2	Data Validation	Mandatory fields captured; auto-number generated without duplication; Category/Subcategory stored accurately; reference fields resolve correctly.
3	Choice & Dependency Validation	Category choices: Network, Hardware, Access, Performance. Subcategory choices depend on Category: Wi-Fi, Projector, Forgot Password, Slow Computer.
4	Automation Result	Flow Designer evaluates Short Description keywords and updates Category and Subcategory automatically.
5	Testing Evidence	Scenario 1: WiFi not working in library – Network / WiFi. Scenario 2: Projector not turning on – Hardware / Projector.
6	Notification / Documentation	Caller receives email confirmation; update set can be completed and exported to XML for deployment/documentation.

Power BI dashboard visualizations and DAX queries are not part of the supplied Auto Ticket Classification project documentation, so no fabricated dashboard or DAX results are included.
