

Functional & Performance Testing Template

Auto Ticket Classification using Flow Designer

Team ID	SWTID-2026-7595
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Ticket Input Validation	Enter Caller Name and a valid Short Description; also test an empty required input.	Valid ticket details are accepted and required information is captured correctly.		
FT-02	Automatic Category & Subcategory	Create tickets containing WiFi/Network, Projector, Password/Login, and Slow/Hanging keywords.	The flow assigns the correct Category and dependent Subcategory automatically.		
FT-03	Dependent Choice Validation	Select a Category and verify the available Subcategory values.	Only the Subcategory values dependent on the selected Category are available.		
FT-04	Ticket Record Update	Create a ticket and verify the Incident Workflow record after Flow Designer execution.	Category, Subcategory and ticket information are stored accurately.		
FT-05	Email Notification	Create a new ticket and check the caller's email notification.	A ticket confirmation email is sent to the caller's email address.		
PT-01	Flow Execution Response Test	Create multiple tickets and observe completion of automatic classification.	Tickets are classified after submission without unnecessary delay.		
PT-02	Multiple Ticket Processing	Submit multiple incident requests with different issue keywords.	The flow processes each ticket consistently without classification errors.		
PT-03	Data Integrity Test	Create tickets repeatedly and verify auto-number, references, Category and Subcategory.	Records remain structured, unique and accurate without duplicate auto-numbers.		

Testing focus: end-to-end Flow Designer automation, dependent Category/Subcategory logic, email notification, and data validation as described in the project documentation.

Source basis: The project uses Flow Designer to classify tickets from Short Description keywords and sends automated email notification after ticket creation.
